

**METHOD AND APPARATUS FOR OPTIMIZING
SUPPLY MODULATION IN A TRANSMITTER**

5 Abstract Of The Disclosure

10 A transmitter (200) has a compression detector for sensing
the level of compression (110) in a signal that is being
transmitted. The transmitter also has a radio frequency power
amplifier (RFPA) (414) that is supplied by a supply modulator
15 (426). The supply modulator provides a dynamic supply bias to the
RFPA to maintain a desired amount of compression in the signal
being transmitted. The supply modulator is responsive to a
modulation signal (207) created by substantially following the
envelope (214) of the signal to be transmitted (212). However,
20 various signal and operational conditions can occur which cause
the compression level to deviate (506) from the desired level.
To maintain the desired compression level, the compression
detector provides an output that is used to adjust the modulation
signal from following the envelope of the signal to be
transmitted in an unadjusted manner.
